

a. Primary care or non-referred patients

b. Secondary care (first level of referral)

c. Tertiary care (teaching hospitals)

d. Mixed population

e. Not specified/unclear

B2. Spectrum of the condition in the "diseased" (according to the reference standard):

a. Combined lesions

b. Only isolated lesion of interest

c. Not specified/unclear

B3. Spectrum of the condition in the "non-diseased" (according to the reference standard):

a. Subjects with various other lesions of the knee

b. Subjects with an isolated lesion of one other knee structure

c. Healthy subjects only

d. Not specified/unclear

B4. Were the inclusion and exclusion criteria defined?

a. Yes

b. No

B5. Was there a description of previous tests / other clinical information to which the index test was being evaluated?

a. yes

b. no

C. The index test(s)

The following questions pertain to all index test(s) to index test:

C1. Was the index test described in sufficient detail to enable its application in one's own practice?

a. Yes, described in text/literature reference

b. No

C2. Was a definition of a positive test result of the index test stated?

a. Yes (please indicate):

b. No

C3. Was the index test measured independently of all other clinical information?

a. Yes

b. No

c. Not specified/unclear

C4. Were subjects excluded because the index test was infeasible or the index test's result was considered indeterminate?

a. Yes (please indicate how many cases)....

b. No

c. Not specified / unclear

C5. Was the reproducibility of the index test described?

a. Yes

b. No
